

Wheat variety response to herbicides in South Australia

This research has been conducted across the mid north of South Australia to determine if new and existing varieties of wheat vary in tolerance to commonly used herbicides

The sensitivity of the variety is summarised, using the following symbols based on the yield responses across all trials:									
- not tested or insufficient data									
✓ (z) no significant yield reductions at recommended rates or higher than recommended rates in (z) trials									
N (w/z) narrow margin, significant yield reductions at higher than recommended rate, but not at recommended rate significant event occurring w years out of z years tested. Eg. (2/5) = tested for 5 years, 2 returning a significant yield loss									
x% (1/z) yield reduction, (warning) significant yield reduction at recommended rate in 1 trial only in z years of testing									
x-y% (w/z) yield reductions (warning) significant yield reductions at recommended rate in w years out of z years tested.									

Always follow label recommendations. All pesticide applications must accord with the currently registered label for that particular pesticide, crop, pest and region. Any research regarding pesticides of their use reported in this website does not constitute a recommendation for that particular use by the authors, the author's organisations of ACAS. It must be emphasised that crop tolerance and yield responses to herbicides are strongly influenced by seasonal conditions.

Research site manager:

David Brunton, SARDI Research Officer (Herbicide Tolerance) (08) 8303 9479

david.brunton@sa.gov.au

Research site location:

Kybunga, Mid North of South Australia

Site soil type :

Friable light clay loam overlying carbonate at varying depths

Site pH :

Water 8.2, CaCl 7.5

Site annual average rainfall:

507 mm
